

Why does a transmission fail? [back... https://topgetriebe.de/defekte.html](https://topgetriebe.de/defekte.html)

Find out more ...

A defective transmission is not a rarity. Often worn bearings, the oil has leaked, abrasion impaired the components or improper handling are reasons for the defect. But when can one speak of a defect?

We recommend the visit of the transmission workshop already with the first notice, because one leads to the other and thus the repair costs tremendously.

Modern vehicles have countless sensors. Also for the transmission. In the normal case, an error should appear in the instrument cluster. However, you may notice a noise and abnormally hard gears during the trip and no error will appear.

That could be the first signs of big problems.

We do not only exchange parts of the transmission, we also find the fault.

Do not wait until your gearbox stops working. A defective component damages another, and so on. You risk your safety and that of other road users when they suddenly stop.

What can we do for you?

We check your vehicle first.

We had often customers where the noise was not attributable to the gearbox, but to engine parts or the bodywork.

We read the error log.

Through our experience, we often have a guess and are looking for the fault.

But certainty is only gained when the gearbox is removed.

With our modern equipment, we can measure individual components and get to the bottom

Quickly on the track.
